It is well documented that people living with mental health conditions are more likely to experience financial difficulties. When explaining this association, emphasis has often been placed on financial capability, i.e. the capacity of those living with poor mental health to manage their money. This paper challenges such capability-based explanations by reporting on a diary study and interviews with 14 people who self-identify as living with a mental health condition. We focused on their experiences of financial technology use, and explored the role technology played in their strategies to minimise the impact of mental health on their economic circumstances. Rather than lacking capability, participants' practices revealed shortcomings of existing financial technologies and how they sought to work around these. We conclude by providing a set of design directions for technologies that engage those living with poor mental health not as vulnerable targets for financial inclusion, but as full financial citizens.

1 INTRODUCTION

People living with poor mental health are more likely to find themselves in financial difficulties. These include relative poverty (i.e. disposable income well below median [29]), hardship (i.e. insufficient financial resources to cover basic needs [29]) and problem debt (i.e. *"seriously behind on payments for a range of bills and credit obligations"* [25]). This association between money and mental health has been called the *"double trouble"* [81], where financial difficulty and poor mental health feed into each other and trap people into a hard to break cycle [28].

Over the last decade, HCI research has started to address the ways in which digital technologies are starting to effect and impact on how people understand, spend and manage their money (e.g. [41, 47, 87]). However, thus far the

53 intersection of money and mental health, and the role technology plays in supporting and burdening people with mental
54 health concerns, has not been examined. This paper addresses this by exploring how people struggling with mental
55 health use financial technologies to minimise the impact of their conditions on their economic situation. **Following**
56 **the World Health Organisation, we understand poor mental health as a lack of well-being that affects individuals'**
57 **capacity to realise their own abilities, cope with the normal stresses of life, work productively and contribute to their**
58 **communities [62].** We use the expression "financial technologies" in a broad and encompassing way. We include in
59 it new financial services built upon digital technologies ("fintech"), near field communication payment technologies
60 such as "contactless", instant lending technologies such as credit cards, as well as digital forms of banking through web
61 browsers and native mobile applications.
62

63
64 In our research, we conducted interviews and a diary study with 14 people self-identifying as living with a mental
65 health problem, to understand how they used financial technologies in their daily lives. **Our goal was not to identify**
66 **financial behaviours associated with certain mental health conditions, or to draw comparisons with the financial**
67 **practices of neurotypical users. We aimed instead to inquire into the experiences of people living with poor mental**
68 **health to provide a critical lense for the examination of technology-mediated financial products and services.** Our
69 participants' experiences reveal the shortcomings of these technologies, and help us formulate new design sensitivities
70 to address them. When doing so, we seek to move beyond the discourse of financial inclusion and its focus on "*access to*
71 *appropriate financial products and services*" [68]. Although financial inclusion has inspired important and valuable work
72 in HCI (e.g. [84–86]), in the realm of policy it has mostly resulted in the development of a simpler, less functional range
73 of financial products designed to minimise the risk of service providers [4]. These products lead to a superficial and
74 shallow engagement with the financial system [4, 56], and do not address the problems derived from financial inclusion
75 itself, such as indebtedness [4]. Rather than financial inclusion, we take inspiration from the concept of "financial
76 citizenship" [49], which demands that people not only have access to financial services, but also the "*opportunity and*
77 *capacity to shape the way the financial system functions*" [4].
78
79

80
81 This paper makes three contributions to HCI research on financial services. First, it investigates and describes how
82 technology is being integrated into the financial coping strategies of those living with poor mental health. Second, it
83 advocates technology as an institution of opposition and resistance to financial exclusion. Third, it proposes a set of
84 design directions that can steer technology beyond financial inclusion and towards contributing to a more participatory
85 model of financial citizenship.
86
87

88 2 RELATED WORK

89
90 **Our work builds upon research spanning three areas: literature on money and mental health, HCI research on financial**
91 **technologies and moneywork, and work on the notion of financial citizenship. We introduce each of these in the**
92 **following sections.**
93

94 2.1 Money and Mental Health

95
96 The connection between poor mental health and financial difficulties is well documented (e.g. [24, 39, 50, 70]). Those in
97 debt or experiencing financial hardship are significantly more likely to have a psychiatric disorder [38], and those in
98 financial difficulty struggle to recover from their mental health conditions [25, 34, 79, 80]. Although the association
99 is clear, the mechanisms of the relationship between money and mental health are complex, and causality is hard to
100 establish [18, 28, 29, 44, 50]. There are two main theories that seek to explain the relationship between money and
101 mental health: social drift and social causation [50, 81]. The social drift hypothesis argues that financial hardship comes
102
103
104

105 as a result of mental health conditions and their impact on our ability to cope. However, the social causation hypothesis
106 argues it is the stresses attached to money problems that cause mental illness [50, 80, 81]. Poor mental health can
107 negatively affect our capacity to work - and therefore our income - as well as our memory, planning, problem solving
108 and communication abilities, all of which can make money management more difficult [25]. This would seem to support
109 the social drift hypothesis. However, studies have also found that recent experiences of hardship and deprivation
110 negatively impact mental health [44, 80], and this would seem to support the social causation hypothesis. Topor et al.
111 conclude that these two theories are not mutually exclusive [81]. The relationship between money and mental health
112 has been described as "*bidirectional*" [25] and "*nonlinear*" [28], with money troubles and poor mental health feeding
113 into each other and trapping individuals in a "*vicious cycle*" [69] that becomes difficult to escape [28]. Improving our
114 understanding of how the cycle of mental illness and financial hardship unravels can help develop more effective
115 interventions to support those struggling with their mental health [25, 35, 44].

116 Existing research into the subject of money and mental health has been mostly undertaken within the fields of
117 psychiatry, psychology, and social work, with a few studies focusing on the daily money practices of people with
118 mental illness (e.g. [13, 28, 34–36, 70, 81]). This research has uncovered several financial "*coping strategies*" [23], i.e.
119 problem-solving behaviours and adaptations that allowed participants to get by [23]. These include i) taking advantage
120 of subsidies, community programmes and other available assistance for housing, utilities, food and leisure [13, 36, 81];
121 ii) relying on social networks [28, 35, 36, 81]; iii) cost-efficient shopping [13, 36, 81]; iv) careful financial planning [35],
122 which involved activities such as budgeting [13, 36], prioritising [13], earmarking [35], spending self-discipline [36],
123 and even doing without basic necessities when needed [81]; v) debt management, which included both avoiding credit
124 [13] and borrowing when necessary [35, 81]; vi) seeking additional income [28, 35, 36, 81] by pursuing activities such as
125 collecting cans, selling cigarettes, taking part in research studies [36, 81] or finding part-time work [28]; vii) attempting
126 to save money [13]; and viii) nominating a legal guardian to manage their finances on their behalf [81]. This body of
127 research has also revealed the main challenges experienced by those with poor mental health when engaging with
128 financial services: cost and lack of friction. Given how poor mental health is often associated with lower financial
129 income [80], this group is disproportionately affected by fees and charges [35, 81]. Lack of friction in payments, transfers
130 and obtaining credit is also particularly damaging for people with mental illness [35]. This is because their symptoms
131 may include impulsive shopping and over generosity [35, 70], as well as a need "*to comfort themselves through spending*"
132 [35].

140 2.2 Technology and "Moneywork"

141 Both Caplan [13] and Harper et al. [35] touch upon the subject of financial technologies in their studies of money
142 practices and mental illness, highlighting their potential for good. Caplan describes how getting welfare benefits
143 deposited into bank accounts rather than paid by cheque, and paying bills online, helped participants save time and
144 money [13]. In their discussion, Harper et al. postulate that "fintech" offers "*promising, low-cost ways to help people add*
145 *friction to their spending, to put money aside as savings, and even to borrow*" [35]. However, their research also exposes
146 some of the problems associated with technology in financial services. For instance, although payday lending and
147 their often abusive practices are illegal in some US states, they remain accessible through online channels. Online bill
148 payments by debit card can move bank accounts into negative numbers even if account holders have not opted into
149 overdraft services, which results in charges and penalties [35].

150 In spite of the contradictions and complexities that surround the introduction of technology in financial services, no
151 study has yet looked specifically at the effect of these technologies in the cycle of mental illness and financial hardship,
152
153
154
155
156

157 or the role they play in the coping strategies and challenges of those living with poor mental health. This is a subject
158 that HCI is well positioned to address, but has yet to do so. A recent literature review of the last decade of HCI research
159 on affective health [72] does not mention any papers looking at financial matters. HCI literature on money has paid
160 some attention to the particularities of managing on a low income (e.g. [76, 77, 87, 89]), and to the financial lives of
161 older adults [19, 84, 86], but not to those struggling with mental illness. Although there is overlap between the financial
162 strategies and circumstances of those living on a low income and those living with poor mental health [35, 81], the
163 latter also face particular challenges. For instance, their symptoms can make it harder to control spending [35, 69, 70].
164 They may also have limited capacity to make financial decisions at certain times [35]. At such times, and akin to studies
165 of the financial needs of older people needing support from carers [84], people suffering from poor mental health can
166 benefit from third party assistance with money management [52]. However, their needs when receiving help with
167 minding money are different from the needs of older adults. Incapacitating age-related conditions are often permanent
168 or degenerative, coming with expectations of increased support over time. By contrast, impairment connected to poor
169 mental health tends to be intermittent and fluctuating [52], with people requiring varying degrees of support at different
170 times. These particularities make those struggling with mental health a distinct population in terms of day-to-day
171 financial practices.

172 HCI can also contribute concepts and frameworks for the study of the financial practices of those struggling with
173 their mental health. Reflecting on the effort required from their participants in order to make ends meet, and the health
174 consequences of their constant preoccupation with money problems, Harper et al. conclude that *"normative conceptions
175 of 'work' fail to capture the labors of those who live with both mental illness and very low incomes"* [36]. **The notion of
176 "moneywork" [66] can help address this issue. The term "moneywork" was initially coined by the sociologist Sandra
177 Colavecchia, who defined it as the "labour of managing family finances" [15]. The concept has been expanded by the
178 HCI literature to include "the physical and social interactions that users make individually and collectively in order to
179 enable transactions" [47]; as well as the hidden labour done by users in order to make money work for them [58]. In this
180 broader sense, "moneywork" has inspired HCI research on alternative currencies [66]; personal financial management
181 [47]; payments for ride-hailing services [40, 58]; loan repayments by rickshaw drivers [61]; and financial third party
182 access [65]. Even before the term "moneywork" was adopted into this field, HCI researchers have demonstrated a
183 commitment to the study of money from the perspective of the hidden work it demands (e.g. [51, 67]). The notion of
184 moneywork, as conceptualised in HCI literature, can thus provide a useful framework for the study of the added labour
185 taking place within the cycle of mental illness and financial hardship.**

194 2.3 Financial Citizenship

195 In a paper published in 1995, Leyshon and Thrift proposed the concept of "financial citizenship" as a form of resistance
196 against the exclusionary practices of the UK banking industry, which during the 1990s started to redirect credit towards
197 wealthier social groups in order to avoid risk, and concentrated branch closures in lower-income areas [49]. The authors
198 compared these exclusionary practices to state borders, since they resulted in a financial system that, like states, creates
199 a distinction between those on the inside (citizens) and those on the outside (non-citizens). The concept of "financial
200 citizenship" was thus coined as a way of *"putting pressure on states to reform their financial systems so that they include
201 rather than exclude"* [49]. In 2009, Leyshon defined "financial citizenship" as a *"concept that recognizes the significance
202 of the financial system to everyday life and confers a right and ability on individuals and households to participate fully
203 in the economy and to accumulate wealth"* [48]. As such the concept of financial citizenship intends to contribute to a
204 *"critical reevaluation of the concept of financial inclusion"* [48], which has been criticised for yielding only market-based
205
206
207
208

209 interventions that engage individuals purely as consumers rather than citizens [48, 54]; for focusing on access over
210 usage [59]; and for introducing new problems, such as indebtedness [4].

211 Proponents of "financial citizenship" share an opposition to the financialisation of the state, which involves the
212 dismantling of public welfare mechanisms and the "responsibilisation" of citizens [3]. The "responsibilised citizen" [3] is
213 required to forgo the public resources they are ultimately entitled to, and become instead individually accountable for
214 their own financial security and well-being [3].

215
216 At the root of "financial citizenship" is also a call for the introduction of democratic oversight of financial processes
217 [3]. According to Ingham, the power to create money is exercised jointly by the state and a banking system over
218 which there is no democratic control [37]. Financial citizenship would entail the recognition that individuals also
219 possess certain rights with regard to the socio-technical system that produces money and maintains its value [37]. Riles
220 builds upon this idea and suggests that citizens must have a role in the stewardship of the economy [71]. They should
221 participate in the choices and decisions involved in financial governance so as to strengthen our collective - and not
222 just our individual - economic well-being [71].

223
224 Through its emphasis on rights and collective well-being, financial citizenship can help us move away from narratives
225 that portray those in financial difficulty as irresponsible [64]; and those struggling with their mental health as fragile,
226 impaired or vulnerable. By insisting on democratic oversight, financial citizenship also undermines processes of
227 individual responsibilisation by foregrounding the role that institutions and socio-technical structures play in our
228 personal financial circumstances. This paper explores the presence and use of financial technologies at the intersection
229 of money and mental health through the HCI concept of "moneywork", and the participatory qualities of "financial
230 citizenship". It does so in collaboration with people who self-identify as living with a mental health condition. In the
231 next section, we describe how that collaboration took place, how data was collected and analysed.

232 3 STUDY DESIGN AND DATA COLLECTION

233
234 The data we report on was collected between July and October 2019. The research engaged with 14 people who
235 self-identified as living with a mental health condition, with whom we carried out a 90-day diary study through mobile
236 messaging and paper diaries, together with semi-structured interviews conducted at the start and the end of this period.
237 Our study had two main purposes. First, we sought to understand and explore the financial practices of those living with
238 mental health conditions and how participants used and integrated financial technologies into money management.
239 Second, we were conducting an evaluation of a new mobile application designed for people living with mental health
240 conditions. For the purposes of this paper, we focus on the former, with the latter being reported separately elsewhere
241 [65]. This paper reports on an entirely different analysis and data to this other work.

242
243 The study started with a semi-structured interview, during which we discussed participants' mental health history,
244 their economic circumstances, money management and banking habits, as well as information and communication
245 technology use. The 90-day diary study commenced immediately after this initial interview, and was carried out through
246 mobile messaging and paper diaries. The paper diaries were designed and printed by the researchers specifically for the
247 study. They invited participants to reflect on their daily financial lives, and included prompts about mood, personal
248 finances, the role of money in activities, events and relationships, as well as space for paper financial artifacts such
249 as receipts. After the 90 days, 13 of the 14 participants agreed to take part in a closing interview, during which we
250 discussed the impact of the study on their money management habits and practices.

251
252 The research was conducted in collaboration with the Money and Mental Health Policy Institute, a UK charity
253 focused on advocating for the needs of people living with mental health problems in the financial services sector and
254

261 shaping policy in this space. As well as supporting the recruitment of participants, they advised the research team on
262 how to engage participants responsibly. Upon their recommendation, the researchers put in place safeguarding policies
263 and procedures. The research received ethics approval from **Northumbria University**.
264

265 3.1 Study Participants

266
267 14 people **who self-identified as living with a mental health condition** were recruited from a sample of 5,000 research
268 volunteers administered by the collaborating charity. **This self-identification was core to the study, which wanted to**
269 **acknowledge the value of subjective experiences and understandings of mental health.** Participants were not required
270 to disclose any details about their age, mental health **diagnosis** or employment status as part of the research protocol.
271 **We did not gather this data in an effort to minimise the private information collected. In addition, we did not consider**
272 **age directly relevant to the study, and nothing in the data we gathered suggested fundamental differences in financial**
273 **technology use based on participants' age.**
274
275

276 Some participants chose to **share information about their age, mental health and employment status** during their
277 interactions with the researchers. Eight disclosed their age, which ranged from 27 to 60 years old; and 12 mentioned a
278 mental health condition, diagnosis or symptom. Four participants reported being diagnosed with borderline personality
279 disorder, three with bipolar disorder, two with post-traumatic stress disorder, one with schizophrenia and one with
280 agoraphobia. In addition, participants disclosed suffering from depression (6), anxiety (4), panic attacks (2), paranoia
281 (2) and psychosis (1). Conditions often co-existed: seven participants reported more than one of them, and the same
282 number acknowledged some kind of physical ailment. These included osteoarthritis, tinnitus, diabetes, fibromyalgia,
283 chronic fatigue syndrome, irritable bowel syndrome and spinal injury. Two participants also had a history of addiction
284 to gambling (1) and alcohol (1).
285
286

287 All 14 participants shared their employment status: five participants were employed full time; eight were off work
288 and received social welfare or income protection benefits; and one worked part time and received welfare benefits to
289 complement their income. 11 participants had personal experience of debt, either in the past or during the time of the
290 study; and five had liaised with debt relief and support services. Debt seemed to derive mostly from credit card and
291 bank account overdraft use. Table 1 summarises the health and financial circumstances of the study volunteers.
292
293

294 All 14 participants owned a smartphone (7 iOS and 7 Android). Eight of them also mentioned having a second device:
295 five a computer and three a tablet. Although as a group they seemed comfortable with digital tools and devices, they
296 were not by any means expert technology users.
297

298 3.2 Data Analysis

299 The study gathered 27 interviews, which **were recorded and resulted** in over 25 hours of audio material. **Average**
300 **interview length was 62 minutes. The study also collected** 283 mobile messages and 8 printed diaries. **Diary use was**
301 **voluntary, and 7 of the 14 participants chose to fill them. P6 also kept a separate personal diary during the study period**
302 **and handed it over to the researchers, for a total of 8 diaries.** To identify the source of participants' quotes within this
303 paper, unique identifiers will be followed by "**_opening**" for the opening interviews, "**_closing**" for the closing interviews,
304 "**_mobile**" for the mobile messages, and "**_diary**" for the paper diaries.
305
306

307 Data was processed as follows: interview audio recordings were transcribed verbatim; mobile messages were
308 exported into text files; and diaries were scanned and transcribed. We performed thematic analysis [11] on the interview
309 transcripts, mobile messages and diaries, applying an inductive approach to the coding phase. **A first round of coding**
310 **was done by the first author using the Nvivo software application. The resulting codes were then discussed and iterated**
311
312

by the first and second authors. The process rendered 188 codes that were imported into a web-based kanban board to enable remote collaboration between all authors during theme development. All authors collaborated in this process, revising and negotiating disagreements in coding and themes. The emphasis during these discussions was not on reaching agreement about which code to apply to a given unit of text, but in developing themes as recurrent topics representing the phenomena under study [53].

Three broad themes emerged during the analysis process: i) activities, tasks and work involved in financial collaboration; ii) use and impact of the evaluated mobile application; and iii) role of technology in money management. In what follows, we delve on the last of these 3 themes, describing how mental health conditions affected our participants' relationship with money; the role that technology played in their financial coping strategies; and the impact of the digitisation of financial service provision.

4 FINDINGS

365 Most of our participants had a *"turbulent"* (P7_opening) relationship with money that was severely impacted by their
 366 mental health. Their conditions affected their ability to work and therefore their income, their spending behaviour and
 367 their motivation to attend to financial affairs. As a result of these challenges, many of our participants had experienced
 368 debt and financial hardship. Despite the clear links between their health and their economic situation, our participants
 369 tended to blame themselves. Although acknowledging the impact of their mental health conditions, many still believed
 370 they were bad at managing money. For example, P13 told us he was *"very crap with money"* (P13_closing), P1 that she
 371 was *"terrible with money"* (P1_closing), and P8 portrayed herself as *"A person who is not good with money"* (P8_closing),
 372 as did P11. P3 said she was *"not very good on numbers"* and *"not a plan ahead girl"* (P3_closing); and P14 found *"quite*
 373 *hard managing money on my own"* (P14_opening).
 374
 375

376 During the study, however, it became clear that participants had developed a keen awareness of their own financial
 377 behaviours, and invested significant effort in building strategies to minimise the impact their mental health had on their
 378 finances. The researchers found them to be rather good with money, and extraordinarily committed to becoming even
 379 better. In what follows, we describe some of our participants' financial coping strategies, and how they were supported
 380 by financial technology. After this we go on to discuss some of the challenges introduced by financial technologies, and
 381 the additional labour they often demanded from our participants.
 382
 383

384 4.1 Technology-Supported Coping Strategies 385

386 Our participants had to contend with the impact of their health conditions over their finances. To get by, they made use of
 387 every *"coping strategy"* [23] identified by the literature on surviving on a low income (e.g. [12, 13, 23, 41, 76, 87]), including
 388 earmarking [41, 87]; monitoring [76, 87]; budgeting [13, 41, 87]; making use of subsidies, community programmes and
 389 support from personal networks [12, 13, 23, 76]; cost-effective spending [13, 76]; raising income through informal or
 390 semi-formal activities [23, 76]; debt management [13, 76]; saving [13]; and spending control [12, 76]. Several of these
 391 financial coping strategies were supported by technology, which played a fundamental role in making them possible. In
 392 what follows, we provide examples of how earmarking, financial monitoring, budgeting, cost-effective spending, and
 393 raising additional income were undertaken using technology.
 394
 395

397 4.1.1 *Earmarking.* Earmarking refers to the practice of designating *"separate uses for particular kinds of money"* [91].
 398 Vines et al. mention how some of their participants still used cash and *"little jars"* for earmarking [87], but none of our
 399 participants earmarked with cash any longer. Earmarking was done through bank accounts and credit cards instead.
 400

401 Current accounts, joint accounts and savings accounts were all used for earmarking. For instance, P8 had designated
 402 the income from one of her welfare payments *"to cover the bills"* (P8_opening). That money was paid fortnightly into
 403 her current account, but she would move it into a separate savings account to ensure it would not be spent on anything
 404 else: *"I have no choice because if I had all the money in my current account, I couldn't guarantee that it would be there to*
 405 *pay the bills"* (P8_opening). For P8, this allocation of funds to essentials in advance was a strategy against her difficulties
 406 with spending control, which were related to her borderline personality disorder:
 407

408 part of my symptoms of my borderline personality disorder is that I have this tendency to obsess over
 409 things. So like when I get an obsession it becomes all consuming. So like I had a thing about Kipling
 410 handbags and I ended up with about 30 of them. I had a thing about tarot cards and I've got about 60 odd
 411 decks now. God knows. So I go through those phases. (P8_closing)
 412
 413

414 P4 similarly used a separate current account for the money arriving from her Christmas savings club. That way
 415 she stopped the funds she had earmarked for Christmas shopping from being used to pay bills or her overdraft. Once
 416

417 more, strict allocation shielded P4 against overspending, in particular her tendency to buy items to self-soothe during
418 depressive episodes, something she compared to "comfort eating" (P4_closing).

419 Our participants also used credit cards for earmarking based on different criteria, such as the type of spending
420 (essential vs. luxury) and the transaction amounts. P14 had two credit cards: she used one of them for essentials like
421 food and fuel, and the other one for non-essential spending and small treats like "hair and beauty" (P14_opening). P14
422 found money management difficult and avoided financial matters while unwell, so this division between essential and
423 non-essential credit cards was likely to support her financial monitoring efforts. P11 also had two credit cards: one that
424 offered 0% interest for purchases, and a second one that offered free cash withdrawals abroad. She used the former for
425 sizable purchases, such as furniture for her new home. The latter was "mostly just for holidays" (P11_opening), and
426 day-to-day spending like fuel and shopping. P11's credit card use was marked by negative prior experiences, where the
427 instant availability of credit had fed the impulse and comfort spending that often accompany bipolar disorder [70]:
428
429
430

431 last year when I was manic, I'd made a £6000 investment in someone who had claimed to be a psychologist
432 who was not a psychologist (...) I've done it with depressive episodes as well and emotional spending.
433 (P11_opening)
434

435 P3 also had several credit cards that were carefully managed due to her past experiences of debt partly caused by
436 comfort spending:
437

438 I don't think I have excessive spending habits now, but I know that definitely did. I would buy all sorts of
439 nonsense that I didn't and never would need, but I did it in an attempt to try to make myself feel better.
440 (P3_opening)
441

442 P3 would use one of the cards for any household-related spending over £100 in order to benefit from purchase
443 protection. She had a second credit card with a higher credit limit that would be used only occasionally for big items
444 like booking holidays. Finally, she had a third credit card that offered free foreign currency transactions, and would be
445 used only when abroad. That card "just sits tucked away. It's actually in with our passports somewhere ready for the next
446 holiday. (...) Then there's no temptation to have some nonsense that you don't need in your life." (P3_opening). P3's credit
447 card discipline was rooted in her experience of debt. In spite of the dangers of easy credit, she trusted the system she
448 had put in place: "it's easy to get out of control but I think I'm managing relatively okay" (P3_opening).
449
450

451 The availability of almost instant money transfer functionality via digital banking facilitated widespread use of bank
452 accounts for earmarking. Six participants (P1, P2, P4, P7, P8 and P12) specifically mentioned transferring money when
453 describing their digital banking use. In the case of credit cards, our participants were apt at identifying and assessing
454 their different features and perks, and carefully allocated spending based on them.
455
456

457 **4.1.2 Financial Monitoring.** Financial monitoring refers to the habit of checking one's finances through "occasional
458 glimpses" [41] in order to maintain a "peripheral awareness" [87] of the state of one's financial affairs. Kaye et al. observed
459 that the most common means of financial monitoring between their participants was accessing Internet banking via a
460 personal computer, with only "some" [41] using their mobile phones. In the case of our participants, all of them used
461 mobile banking apps for financial monitoring. In fact, that was the main reason for engaging with such apps.
462

463 For some participants, mobile app use came with additional challenges related to their mental health. For instance,
464 P2 had decided to give up using her bank's mobile banking application, along with other apps on her smartphone, in an
465 effort to minimise distractions and address her concentration and attention problems. However, she had started using
466 mobile banking again six months before our study because her account had started falling into overdraft. She felt she
467
468

469 needed "to keep tabs on things" (P2_opening), and reinstalled her mobile banking app specifically for that purpose in
 470 spite of the negative effects it could have on her concentration.

471 For some, financial monitoring involved checking balances, verifying incomings, tracking automated bill payments,
 472 and keeping an eye on outgoing transactions:
 473

474 I'm double checking transactions have gone through and when they went through. I double check direct
 475 debit dates. (...) I check the amounts are correct and I particularly check not going below a certain amount
 476 as well. (P9_opening)
 477

478 These activities not only contributed to awareness: they also allowed participants to ensure they had enough funds
 479 in the right places to meet their financial commitments: "I just check my direct debits. I check the dates when they are
 480 coming out so I know then that I need more money in there at that particular time" (P4_opening). P6 and P9 felt that
 481 this monitoring also protected them against fraud, and checked their accounts to ensure "that there hasn't been any
 482 fraudulent activity" (P6_opening).
 483

484 For our participants, digital banking in general, and mobile banking in particular, had become the main ways of
 485 monitoring their finances. Tracking money was particularly crucial for them, given the negative impact mental health
 486 conditions had on their income. Eight participants (P1, P2, P4, P6, P8, P10, P12 and P13) were forced to stay out of work
 487 altogether, which meant getting by on meagre welfare benefits. For others, like P11 and P9, poor health affected the
 488 amount of time they could dedicate to work. For instance, P9 was forced to work only part-time, and had to rely on
 489 state benefits to top up her income. Having to survive on a reduced income was also the main factor behind budgeting
 490 efforts, to which we turn next.
 491
 492
 493

494 *4.1.3 Budgeting.* According to Caplan, budgeting "describes a systematic way to track and plan for expenses" [13]. Three
 495 of our participants engaged in this kind of systematic budgeting (P5, P9 and P11) with the support of digital tools. P9
 496 also maintained a paper tray in order to aid coordination with her husband - who disliked digital financial tools - and
 497 as an insurance policy against technology glitches and annoyances:
 498

499 we've created a paper folder between us so that all of the direct debits are all printed out and we've got
 500 copies (...) for each, whether it's utility or it's [mobile phone provider] or whatever, so that any time, you
 501 now, technology decides to be annoying or just overcomplicated, we have got that file. (P9_closing)
 502

503 For herself, P9 had experimented with several money tracking apps, and had settled on a particular one because of
 504 its short-term planning capabilities:
 505

506 I have been using some other apps (...) to try and keep a handle on things, particularly Emma because you
 507 can track your future payments. Sometimes it is not just about what you have spent or are spending or
 508 amounts of money. It's that future thing: what have I got coming up in the next week or two that we need
 509 to be aware of? (P9_closing)
 510

511 P5 and P11 instead made copious use of spreadsheets, which required substantial manual data entry and tracking.
 512 For both participants, this monitoring habit had been prompted by a sudden period of financial difficulty. This is similar
 513 to findings from Buckland et al., who reported that participants' drop in income "forced them to either begin budgeting
 514 or to budget more strictly" [12]. P11 had recently started her spreadsheet after ill health prevented her from working:
 515

516 I've had to take time off work for a little while with ill health so we are putting a spreadsheet together to
 517 make sure we can cover these periods for future occurrences. (P11_mobile)
 518

519 P5's spreadsheet started with his divorce:
 520

521 because of divorce that started 3 years ago, my financial situation was quite dire let's say. So I really had
522 to be very, very anal in managing my money because it was, you know: I was struggling to pay for food,
523 let's say. Even though I had a good income the situation dictated that. I had to be really strict on myself
524 with finances. (P5_opening)
525

526 P11 tracked her personal spending with the spreadsheet, and made "*personal budgets*" that included "*best case/worst*
527 *case*" scenarios "*for a couple of months at a time*" (P11_opening). P5 kept his spreadsheet "*on a cloud*" (P5_closing), so that
528 he could access it from anywhere and any device. In it, he included all his bank accounts and credit cards, all automated
529 bill payments with their due dates, and all regular payments such as rowing club fees and child maintenance. He added
530 manually all card transactions and cash withdrawals on a daily basis. He also took the trouble of reconciling it with
531 the mobile banking app: "*I go on [the mobile banking app] to check my balance and my transactions and tick it off my*
532 *Excel spreadsheet*" (P5_opening). This detailed tracking system allowed him to "*know exactly where I am*" (P5_closing) in
533 financial terms.
534
535
536

537 **4.1.4 Cost-effective Spending.** Cost-effective spending [13] refers to the various means by which people attempt to pay
538 as little as possible for products and services. These include, for instance, "*carefully checking catalogs and supermarket*
539 *shelves*" [76] for special offers, buying in second-hand or discount stores, buying in bulk, using coupons and loyalty
540 cards.
541

542 Many of our participants' cost-effective spending strategies involved digital technology. P7, for example, made the
543 best of the features provided by traveling websites in order to spend as little as possible on trips, and to protect himself
544 from losing money if he could not travel for **mental** health-related reasons:
545

546 I like to travel as much as possible and do it on an extremely tight budget. As opposed to looking for a
547 specific destination I look for the best deals on flight, as cheap as £32 return for my next one. I then book
548 budget accommodation on [hotel booking website], only bookings that I can cancel up to the day before
549 arrival. I do this in case I get hype or depressed and can't travel. It means I'd only lose the cost of the
550 flight. (P7_diary)
551
552

553 P2, P6 and P19 mentioned buying through cashback websites. P2 and P6 happened to use the same one: TopCashback,
554 which is popular in the UK. P2 explained how you can get pretty much anything through it: "*your new mobile phone*
555 *contract, change your new broadband provider, or even your electricity or gas*" (P2_closing). During the study, P6 used
556 TopCashback to buy a tin of paint for her mother, and her new iPhone. P3 used her bank's cashback programme instead,
557 which was available via her mobile banking app:
558

559 they have this retailer offer thing where you get cash back if you spend with them. Sometimes you think,
560 well I shop there frequently so I might as well just use it, get these bonuses. It's not much, it's not a
561 fortune, but it's worth a look. (P3_opening)
562
563

564 She would also check this cashback programme for restaurant offers before treating the family to a meal out. P5, P6
565 and P9 used price comparison websites to get the best possible deals. P5 described how he used them to review his bank
566 and utility providers every year:
567

568 I joined [my bank] three months ago, four months ago because they were offering £125. Plus, if you stay
569 with them 12 months, you get £50. I pretty much each year look at all that kind of stuff. Utility bills, I
570 make sure each year I go onto a comparison site and get the best deals. If there's a bank account that's
571
572

573 offering me some money to change, it's so easy to change nowadays, why not do it ... £125 is £125 at the
574 end of the day. (P5_opening)
575

576 Finally, P5 and P7 had opened accounts with some of the new UK mobile-only banks, known as "neobanks" [21], to
577 save on foreign transaction fees: *"if you use it abroad, there is no charges from that and it's like a really good exchange*
578 *rate you get"* (P7_closing). P5 used his neobank account exclusively for traveling: *"I've just used it for going abroad. (...)*
579 *they don't charge you a percentage for the exchange rate and you get the best exchange rate as well. If you're going abroad,*
580 *it's stupid not to use it really"* (P5_opening).
581

582 As illustrated by the examples above, participants made the best of digital services to optimise their spending.
583

584 **4.1.5 Raising Additional Income.** Studies about living on a low income have shown that people often resort to informal
585 or semi-formal activities to raise additional money (e.g. [23, 35, 36, 76, 81]). For instance, some of Snow et al.'s participants
586 sold *"household items through informal economies such as Gumtree, Facebook and local markets or jumble sales"* [76]. Three
587 of our participants did so as well (P3, P5 and P10), but exclusively through digital marketplaces: no brick-and-mortar
588 markets were mentioned.
589

590 When going through the apps installed on his phone, P5 listed Shpock and Gumtree, which he used *"if I want to sell*
591 *some stuff"* (P5_opening). P3 wrote in her diary about *"trying to turn items into cash. It feels productive"* (P3_diary). She
592 mentioned listing her items on Facebook Marketplace and eBay.
593

594 *This income-generating activity was particularly meaningful for P10, for whom the impact of poor mental health had*
595 *been sudden and severe. P10 was a teacher and had been in full-time employment until relatively recently, when her*
596 *health situation deteriorated and caused her to stop working. Unable to keep up her mortgage payments after losing*
597 *her income, she had been forced to put her house up for sale and move in with her mother. She felt ashamed about her*
598 *situation and was eager "to go back to work and be independent again"* (P10_closing). With help from her sister, she had
599 started to look *"at practical ways that I can improve my finances and selling things that I don't need on eBay (...) I do give*
600 *a lot of things to charity, but I've set up eBay for the first time ever instead of giving it to charity"* (P10_closing). For P10,
601 the ability to engage in this income-generating activity represented a step towards regaining control over her life.
602
603
604

605 **4.2 The Impact of Digitising Financial Service Provision** 606

607 All of our participants were smartphone users, banked online and on their mobile phones. They found Internet banking
608 useful, and seemed satisfied with their banks' mobile banking applications. As demonstrated by the coping strategies
609 described above, they made the best out of the opportunities offered by financial technologies. However, they also
610 identified aspects of the digitisation of financial service provision that significantly hampered their ability to manage
611 their finances. These included adding difficulty to financial monitoring, constant temptations to spend, lack of friction
612 and increased money management work.
613
614

615 **4.2.1 Adding Barriers to Financial Monitoring.** Participants brought up the consequences of the move from cash to
616 cards. P8 believed that *"since we took the physicality out of money, it's made it harder for people to realise what they are*
617 *spending"* (P8_opening). P3 explained that sometimes she would *"try to just take the cash out and not touch any cards.*
618 *(...) Sometimes having the money in your hand seems a little bit more real than bits of plastic"* (P3_opening).
619

620 Some participants disliked the delay between paying by card and the transaction appearing in their bank accounts.
621 P8 explained that *"sometimes you pay in a shop and it doesn't come off your balance for a couple of days"* (P8_opening).
622 P5 observed how, after paying by card, merchants *"don't necessarily like to give you a receipt, so you don't have a record*
623
624

625 *particularly. So you only find out a few days after" (P5_closing). Delays in transaction recording made it harder to*
626 *maintain an up-to-date awareness of the state of one's finances, and introduced doubt and uncertainty in reported*
627 *balances. The consequences of the dematerialisation of money and the impact of delays on financial monitoring may*
628 *have been particularly noticeable for our participants, given their difficulties with spending control, their struggles*
629 *with motivation, and their reduced income.*

631 P9 found that the move to digital banking had made it harder for her and her husband to collaborate in the management
632 of their household finances. Digital banking required them to access their joint account separately through their personal
633 banking credentials, something P9 perceived as isolating. The strictly individualised digital access to the joint account
634 compared badly to the experience of paper statements:

636 we've got a joint bank account, but we are often not viewed as a couple. (...) He's always seen as a separate
637 entity, but he is not a separate entity. We've never thought of ourselves in that way (...) you'd get your
638 statement in the post previously that you were both immediately able to open because it was Mr & Mrs. It
639 was to both of you and therefore you can both look at it together. That's completely gone, you're now
640 treated as two separate people. (P9_opening)

643 P9 believed her and her husband should have a joint way of accessing digital banking that replicated the experience
644 of reading the same paper statement. Because this did not exist, they developed their own workaround: P9 would access
645 the account using the mobile banking app on her smartphone, and her and her husband would look at the information
646 on the screen together.

648 Existing digital banking tools, albeit useful, did not compensate for these shortcomings. Participants asked for
649 improvements in terms of "*reporting and tracking*" (P11_opening) of expenses, particularly those involving small amounts.
650 They also wanted tools that helped them with short-term planning, calculation of "*projected spend*" (P9_opening), and
651 ring-fencing money for essential bills. They observed that, in spite of all the technologies available, they still needed to
652 calculate for themselves simple and obvious personal financial metrics, such as what their disposable income would be
653 for the month, or whether their balance would cover their bill payments within the next 2 weeks.

656 4.2.2 *Constant Temptations to Spend.* Participants appeared subjected to constant temptations to spend, particularly
657 from online services. This posed a serious challenge to their financial stability, since it compounded with the negative
658 impact of their mental health conditions on their spending behaviour. Each participant had their own "*downfall*"
659 (P4_opening). For P2, P8 and P13 it was e-commerce services like Amazon and eBay: "*I shouldn't have the Amazon app*
660 *and I shouldn't have the eBay app. They're dangerous*" (P8_opening). For P4, **who had a history of problem gambling**, it
661 was freemium mobile games and online bingo. She was trying hard to keep away from online gambling sites, which for
662 her acted as a comfort mechanism:

665 last week I went back on to [online bingo service] (...) but I haven't been on any gambling sites. I've kept
666 away from them ... but that's what I go back to. I go back to a familiar place. That like settles my head, but
667 then, you know, it is not good. (P4_closing)

669 For P3, the problem was offers delivered by text or email:

671 the text comes or on email: 'try this'. And you know actually, before it came through, you weren't going
672 to try it. Suddenly you might have gone and spent £40 that you weren't going to. (P3_closing)

673 P3 also commented on how the lack of friction in contactless payments could lead to overspending, and called this
674 payment technology "*a danger zone*" (P3_closing). Even financial mobile apps could act as an invitation to spend. P14
675
676

677 considered her mobile banking app a useful tool *"to keep track of things"* (P14_opening), but she also pointed out that
 678 the app had a darker side:

679
 680 sometimes it will work in the opposite way, because then it's like I see I've got a little bit of credit or I've
 681 got some money in my account, so I spend it rather than just leaving it alone and not thinking about it. So
 682 yes [laughs] good and bad sometimes. (P14_opening)

683 She had the same issue with the mobile apps offered by her credit card providers:

684 again sometimes that can be a bit negative because if my credit's gone up, I will apply for more credit, so
 685 sometimes that can have an adverse effect. [Laughs] (P14_opening)

686
 687
 688 Participants also felt it was far too easy to obtain credit. According to P4, the availability of this *"easy money"*
 689 (P4_closing) caused an over-reliance on borrowing and contributed to untenable amounts of personal debt. One of
 690 P4's purchases provided an example of this technology-enabled easy credit. With her first grandchild on the way, P4
 691 stumbled upon what appeared to be a heavily discounted nursery set. Since she couldn't afford to pay it outright, and
 692 could not borrow any further from her bank, she used PayPal's credit facility instead:

693 I didn't pay that out of my normal account. I got PayPal credit (...) you get 4 months interest free to pay it.
 694 So as long as you pay within the 4 months, you're alright like, so that's not a problem. (...) I have to pay
 695 £100 a month now for the next 4 months. (P4_closing)

696 She reflected on this experience, noting how in reality she did not have the spare funds for several months in a row
 697 to pay back what she owed, and could not really afford the amount she had borrowed via PayPal. Through constant
 700 temptation, both in terms of spending and credit, financial technologies undermined our participants' efforts to keep
 701 their spending under control.

702
 703
 704 **4.2.3 Bringing Friction Back.** Several participants had developed strategies to compensate for the lack of friction in
 705 both spending and getting credit. For instance, to stop himself from spending, P7 handed over funds to a trusted third
 706 party for safeguarding:

707 I had an insurance policy which is due to pay out in a few weeks. It's not a huge amount but will get me on
 708 a few trips. I've given half of it to my wife so I won't spend it. I'm keeping it if I ever need a replacement
 709 car. (P7_diary)

710
 711
 712 **Motivated by the risk of impulse spending connected to his bipolar disorder, P7 had also started to experiment with**
 713 **lockable "saving pots",** a feature provided by a neobank with which he had opened an account: *"The saving pots (...)*
 714 *you can lock them, so you can't try to spend it on anything. So then, if I was feeling manic, I would ... you know what I*
 715 *mean"* (P7_opening). In terms of credit, P7 also protected himself by opening a "basic" bank account that did not offer
 716 an overdraft facility, an action often recommended by debt support charities in the UK [14]. **At the time of the study, P7**
 717 **was repaying credit card debt accrued during a manic phase when he was unable to control his spending, an experience**
 718 **that made him wary of credit facilities:**

719
 720
 721 I'm down to a basic bank account so I can't go overdrawn or anything like that. I'll not be able to get
 722 credit which I don't want. I'm quite happy with that. I've had enough of credit cards and things like that.
 723 They're just not for me and my problems. (P7_opening)

724
 725
 726 P10 had a basic bank account as well, **which she opened as part of her debt repayment plan. In her case, debt**
 727 **accumulated after being forced out of work for health reasons, and due to the lengthy process of applying for welfare**

729 **benefits, during which she had no income. P10's basic bank account** came with a top up debit card. She appreciated
730 how the card added friction into her spending by introducing an opportunity to reflect:

731 I like how I can't just spend money, I have to actually think about it and transfer it onto the card first. I
732 can't just walk into a shop and just spend money without thinking. (P10_opening)

734 Giving oneself the chance to think seemed a simple but effective way of exercising control. This approach was also
735 behind P3's strategy of letting online baskets rest overnight as a way of managing spending impulses:

737 So this sounds really weird, but I am going to tell you anyway. When I feel I need to buy stuff, I go online
738 and fill a shopping basket and then I don't actually go any further with it. I just leave it overnight then go
739 back to it in the morning and delete everything because actually I don't need any of it. So it is really funny,
740 if you just leave it a few hours how it can change. So I have saved myself a fortune doing that. (P3_closing)

742 P2 had developed a similar habit, that in her case involved deleting items after filling the shopping basket: *"I browse
743 buy up to 200 (...) then after that I just go through and delete, delete, delete. [Laughs] Kind of crazy"* (P2_closing).

745 Perhaps the most extreme attempt to bring friction back was provided by P14 who, **during a mental health crisis**,
746 decided to put all her money in the hands of her husband:

747 I think that I need to have some checks and balances in place. We've tried different things in the past (...)
748 and for a little while, when I had my last really bad episode, my husband just dealt with all the finances
749 (... he took charge of everything and I had to (...) say if I wanted to go to the hairdressers, I had to say:
750 can I borrow a card or could I have the money type of thing. (P14_opening)

753 This strategy proved unsustainable, but illustrates the difficulty of finding a *"happy medium"* (P14_opening) in terms
754 of financial friction: *"I found it too constricting, and it's quite hard to find a middle ground really where you don't feel like
755 you're being, sort of, not exactly controlled, but being monitored"* (P14_opening).

756 Left to their own devices, participants had to develop their own workarounds to compensate for the lack of friction,
757 since financial tools offered little or no support in this regard.

760 **4.2.4 Additional Moneywork.** Although financial technologies delivered convenience and streamlined certain tasks
761 such as bill payments and bank transfers, they also introduced new forms of moneywork. In some cases, they required
762 extraordinary amounts of time, energy and effort. P9 wrote in her diary about using *"different apps, voucher schemes +
763 cashback sites to save money. It can be time consuming and hard work but it's gotta be done"* (P9_diary).

765 Cashback services and price comparison websites seemed particularly demanding, often for little returns. P6 described
766 for us in great detail what was involved in purchasing her new smartphone through one of the cashback services
767 available in the UK:

768 I purchased my new phone contract via TopCashBack (TCB), as I do with all my online purchases where
769 possible. First irritant was that the day before I placed my order, the cash back rate was £130 however
770 it had decreased to £70 when I came to order. I then found that Quidco were offering £120 so I took a
771 screen print of it so that I could send to TCB for processing under their highest cashback guarantee policy.
772 Second irritant was that for some reason my cashback transaction didn't track properly and failed to show
773 in my account after seven days so I had to submit a query ticket to TCB for them to investigate. (P6_diary)

776 In order to get an amount close to the £130 initially offered, P6 had to check how much cash back was offered by a
777 competitor, get evidence of it being higher than the one offered by her chosen service, and submit the corresponding
778 claim. In addition, she was forced to query the transaction, since it somehow managed not to appear in her account
779

781 after 7 days. Finding that out would of course have required her to remember checking her cashback account after
782 the 7 days had passed. P6 ended up receiving £120 for the transaction, which seems a sizable amount. However, P2's
783 testimony paints a different picture of the returns one can expect from the time and effort invested in using these
784 cashback services. She told us that 4 years using TopCashback had yielded £800: just a little over £16 per month.
785

786 The returns of price comparison websites seemed even lower, but participants used them following recommendations
787 from money advice services that position comparing products to get the best deal as financially responsible. P6 described
788 for us what was involved in following this advice when renewing car insurance:
789

790 I always make the effort each year to shop around to see if I can get a better price (...) As per my usual
791 routine, I followed the guidance provided by Martin Lewis and began by obtaining quotes from the
792 comparison sites Money Supermarket, Confused.com, Go Compare, Compare The Market and Quotezone.
793 (P6_diary)
794

795 As if comparing prices across 5 different websites wasn't enough, P6 also obtained quotes from 2 additional providers:
796 "Direct Line and Aviva, as these don't feature on comparison sites" (P6_diary). In addition, she "ran a 'new customer'
797 quote" (P6_diary) using the website of her current insurance provider. After half an hour on the phone with them, her
798 "haggling paid off" (P6_diary) and P6 managed to obtain a discounted price for new customers in her insurance renewal.
799

800 This participant invested a whole afternoon running price comparisons across 5 websites, obtained quotes from 3
801 additional insurance companies, and spent half an hour on the phone in order to save £60 a year: just £5 per month in
802 return for a whole afternoon of intense moneywork. It is those for whom small amounts like this can make a difference
803 who take on the disproportionate amount of work needed to save them.
804
805

806 5 DISCUSSION 807

808 The findings of our study highlighted how, while our participants perceived themselves as "bad with money", their
809 financial coping strategies and the way they integrated technology into them demonstrate self-awareness, knowledge
810 about their health conditions, financial capacity, as well as motivation and willingness to improve their economic
811 situation. This resonates with prior research, which found those living under the "double trouble" [81] of financial
812 hardship and mental illness resourceful [13], hard working [36], and "essentially able to manage living under strained
813 financial circumstances" [81]. Financial capacity is, for the most part, not the problem. In spite of this evidence, initiatives
814 connected to money and mental health continue to focus on individual capacity, for instance by providing financial
815 literacy training [35], as well as coaching and other therapeutic activities intent on convincing recipients they can free
816 themselves from "the traps of debt, poverty, unemployment and disability" [18]. This emphasis on capacity reflects a
817 broader trend to individuate financial hardship, which is "assumed to stem from individual deficits" [34]. This individuation
818 can be observed in both health provision and public policy. Topor et al. comment on the "tendency to medicalise and
819 pathologise the habits of people living in poverty" [81]. Davies et al. criticise policy narratives based on the concept of
820 vulnerability that "seek to individualise debt as a personal problem" [18]. According to this "vulnerability framework" [18],
821 we are solely responsible for finding ourselves in financial difficulties, which are the result of our very own failures [18].
822

823 Our findings suggest that financial technology is also contributing to this tendency to individuate financial hardship
824 and place responsibility on those who suffer from it. It does so in two ways. First, by individuating the medium of
825 exchange. As Pahl has observed, "financial services and products have always been based on the idea of the individual
826 consumer" [63]. New forms of money such as debit and credit cards transfer these ideas into the domain of payments.
827 Compared to cash and cheques, they are "an essentially individualised medium of managing and spending money" [63].
828
829
830
831
832

833 This individuation can be observed in digital banking as well. Like most online services, digital banking assumes that
834 each digital account *"will only be accessed by one person, ever"* [1], enforcing *"a strict one-to-one relationship"* [1] to access
835 control even for joint bank accounts. These can be accessed by all account holders, but only through their individual
836 digital banking identities, as P9 shrewdly observed. Digital banking even enshrines this strict individualisation through
837 its terms and conditions [1]. Sharing digital banking credentials with someone else constitutes a breach of the bank's
838 terms of service, and cancels all fraud protections [22]. Logging into someone else's digital banking, even if just to
839 provide help with minding money, is considered a *"fraudulent behaviour"* [22]. Digital banking effectively enforces
840 individuation, penalising any attempt to bypass it.
841

842 The second way financial technology contributes towards the individuation of financial hardship is through its
843 relentless focus on optimisation. This was the driver behind most of the tools discussed by our participants, such
844 as cashback and price comparison websites, *"voucher schemes"* (P9_diary), credit rating services, financial assistants
845 and micro-savings applications. The responsibility to optimise one's income was also very much ingrained in our
846 participants' practices, as could be appreciated in their regular use of such tools, as well as the time and effort invested
847 in order to save meagre to modest amounts. The vast majority of "fintech" tools targeting consumers seem intent on
848 helping us make the most of our money. This includes comparing products and services *"to ensure you find the best
849 deal for your needs"* [74]; strengthening *"your credit history (...) by reporting on-time rent payments"* [17]; assisting with
850 budgeting by showing us where we spend our money and identifying *"areas for improvement"* [82]; getting us to save
851 *"no matter your paycheck's size"* [31]; or helping us understand our financial circumstances and giving us debt advice
852 if needed [83]. As useful and convenient as they may be, these digital services never question whether the resources
853 being optimised are actually sufficient to cover someone's needs, whether accrued debts are fair or should be contested,
854 or whether the transaction data they are collecting indicates financial hardship and, if so, how to address it. In their
855 drive for optimisation, these fintech tools effectively transfer all responsibility for financial well-being to the individuals
856 who use them.
857

858 When technology reinforces the individuation of finance, it draws attention away from the role that institutional
859 factors play in financial difficulty, and ignores that the association between poverty and mental health is *"a multi-
860 dimensional systemic social issue"* [28]. The progressive withdrawal of government support, benefits and subsidies;
861 a financialised economy increasingly reliant on debt; precarious labour markets [18]; lack of access to suitable and
862 affordable financial tools and services; and the fundamental contradiction in banking between pursuing profit and the
863 measures that would truly help those struggling to make ends meet [35] are some of those institutional and structural
864 factors that contribute to financial hardship. All of them take a back seat while designers of financial technologies
865 concentrate on optimising scant and ever diminishing resources. Prioritising optimisation also means we are paying
866 less attention to the other design problems currently present in our financial technologies, such as the lack of friction
867 and the barriers to financial collaboration.
868

869 5.1 The Design Shortcomings of Financial Technologies

870 Perhaps enticed by the promise of reduced marginal costs per customer [20], the financial industry seems to take
871 for granted that introducing technology delivers convenience and makes it easier for people to manage their money.
872 Although financial technologies do have strengths and advantages, in their current form they also have limitations and
873 problems. These can be appreciated through the experiences and practices of those struggling with their mental health
874 and their finances. In our participants' narratives, we can observe several dichotomies. For instance, Internet banking
875 and mobile banking apps facilitate earmarking, and thus careful allocation of funds, through bank accounts. They do
876

885 so by enabling easy and almost instant transfers seven days a week all year round. At the same time, earmarking is
886 undermined by the very same ease of transfer that makes it possible, since the careful allocation of funds becomes trivial
887 to undo. In another example, all participants valued the contribution of mobile banking apps to financial monitoring,
888 as these apps helped them remain aware of the state of their finances. However, as P14 explained, being constantly
889 reminded of the availability of spare money or additional credit becomes a temptation to spend. Finally, financial
890 technology's promise of convenience clashed against the additional "moneywork" it required from our participants.
891 Although we no longer need to visit our local bank branch to pay our bills or transfer money, financial technologies
892 place new demands on us that cancel out some of their purported efficiencies. Updating payment details in a myriad of
893 ecommerce services every time our bank cards expire, cancelling or changing direct debits when we move accounts,
894 trawling through dozens of options in price comparison websites to find a suitable deal, negotiating the quirks and
895 glitches of cashback sites, and experimenting with an endless stream of new tools and services are some of the additional
896 tasks our participants had to undertake in order to engage with financial technology.
897
898
899

900 Of the design issues surrounding financial technologies, one of the most pressing for those living with poor mental
901 health is the lack of friction [35]. This is due to the fact that impulsive and compulsive behaviours, as well as comfort
902 spending, are common symptoms in mental health conditions [35, 69, 70]. Lack of friction is present in both obtaining
903 and spending credit [35], and prompts the development of personal strategies to add resistance in both domains. Handing
904 over money to others for safekeeping, seeking bank accounts without overdraft services, using pre-paid debit cards,
905 experimenting with neobanks' "saving pots", and letting online shopping carts "rest" overnight are all workarounds
906 to increase friction that were deployed by our participants. Snow et al. describe a money tin devised by one of their
907 participants that could only be accessed with a can opener, and where the difficulty of getting to the money inside
908 helped spending control [77]. Through the lens of those trapped in the cycle of mental illness and financial hardship,
909 lack of friction morphs from a symbol of convenience and choice into a deeply problematic feature, one that demands
910 urgent attention from designers. The compelling effects of introducing friction in financial technologies are illustrated
911 by Ferreira et al.'s account of SMS payments with the Bristol Pound [27]. The authors describe how a somehow slow and
912 cumbersome payment system generated opportunities for playful and pleasurable interactions, social and community
913 contact, engagement with local places and reflection about consumption and means of payment.
914
915
916

917 A second area in need of attention from designers is financial collaboration. Research about managing on a low
918 income, as well as on money and mental health, has repeatedly shown the importance of social networks of support as
919 a financial coping strategy. Vyas and Dillahunt describe in depth the significance of community and sharing practices,
920 and how they contribute to resilience in times of financial crisis [89]. Davies et al. observe how successful ways of
921 dealing with personal debt "*involve seeking help and sympathy from others*" [18]. Topor et al. identify having a social
922 network "*willing and able to provide help*" [81] as a key condition to manage in relative poverty, and list nominating a
923 legal guardian during periods of crisis as one of the coping strategies of those living with mental illness. Ware and
924 Goldfinger found that pooling resources and house "*loan funds*" helped alleviate poverty between people with mental
925 illness living in shared accommodation [90]. Forchuk et al.'s participants identified "*having supportive relationships*" as
926 one of the factors that helped them financially [28]. Enabling assistance with minding money and third party financial
927 oversight has become an ever-present policy recommendation in the UK [8, 57, 60]. Meanwhile, collaborative features
928 in financial technologies have been mostly limited to bill splitting (e.g. [5, 10]) and peer to peer mobile payments (e.g.
929 [6, 7, 78, 88]). Albeit useful and convenient, these apps and features demonstrate a somehow superficial understanding
930 of the meaning and impact of financial collaboration.
931
932
933
934
935
936

5.2 Towards Technologies for Financial Citizenship

Harper et al. appear confident about the potential of digital technologies to improve financial services for those living with mental illness, and list some examples of companies in the US that have begun to address both friction and financial collaboration [35]. Some progress has also been made in the UK, where some banks now allow customers to block payments to certain retailers (e.g. [30]), and technology startups are starting to engage with issues at the intersection of money and mental health (e.g. [45]). However, initiatives are limited in scope and seem mostly driven by competition pressures, rather than users' experiences and practices. There is still a dominant emphasis on optimisation, and the individualisation of money that comes with it, which obscure the importance of collaboration in our personal financial lives; turn friction into something to be removed, rather than carefully fine tuned; and conceal the influence of institutional and social factors on our financial circumstances. Designers must move beyond optimisation and tackle friction, collaboration and context if they are to fulfill the potential of financial technology for those trapped in the cycle of mental illness and financial hardship.

In terms of ways forward for design that speak to the practices and desires of our participants, we suggest useful insight can be gained by drawing on the concept of financial citizenship. The term was proposed by Leyshon and Thrift in the context of developing opposition and resistance to exclusionary practices in the financial industry [49]. Although questioned for not challenging the ongoing process of financialisation in economic and social life [3, 42], financial citizenship does seek to move beyond discourses of inclusion to introduce ideas of participation and influence. The financial inclusion agenda has been criticised because it leads to superficial engagement with financial services, and does not help individuals to exercise power within the financial system [4]. Like financial inclusion, financial citizenship requires that people have access to the products, services and resources they need for financially responsible behaviour. However financial citizenship also requires participation, i.e. that people are given *"the opportunity and capacity to shape the way the financial system functions"* [4]. As Berry and Serra succinctly state: *"Inclusion alone does not guarantee citizenship"* [4].

Financial citizenship demands an active role from the state, which must guarantee access to appropriate financial products and services [4, 49]. We argue that the technologies that increasingly mediate financial service provision should also assume an active role in the pursuit of financial citizenship. **To do so, financial technology design must shift away from financialised market agendas oriented towards short-term profit [3], and introduce principles of i) opposition against exclusion and the systematic responsabilisation of individuals, ii) democratic oversight of financial processes, iii) citizens' stewardship of the economy and iv) collective well-being.** Financial technologies should strive to become a vehicle through which citizens can exercise influence over how financial institutions operate. They must also work towards systems that legitimise and enable the capabilities, skills and practices that citizens have developed to manage their financial lives, rather than medicalising, stigmatising and penalising their behaviour. In doing so, technology may become not only an *"institution of resistance"* to the process of *"financial infrastructure withdrawal"* [49] that drives financial exclusion, but also a tool for democratic oversight of the socio-technical system that produces and maintains money [37]. In what follows, we propose a set of technology design directions that can help engage financially excluded groups as financial citizens:

1. Configurability: Financial technologies, as currently designed and deployed, de-personalise and standardise service provision to save costs. This reinforces existing processes of customer commodification [49]. We propose to design for configurability instead. Configurability would provide a layer of options on top of standard financial services, so that people can customise those services to their personal financial practices. Many of the features that have been

989 recommended to the financial industry in the context of mental health fall within this configurability concept. For
990 instance, the ability to create alerts based on transaction amount, time of day and merchant [26]; the ability to share
991 such alerts with a trusted third party [57]; read-only access to online banking [26, 57]; or "self-imposed" spending limits
992 on debit cards and ATM withdrawals [26].
993

994 **2. Complementarity:** Within the financial industry, technology is mostly considered a gateway to operational
995 efficiencies, i.e. a way to save money by replacing more expensive channels for service provision such as bank branches
996 and telephone contact centres. We propose that financial technologies should aim not to replace other service channels,
997 but to complement them. They should be understood as one more option within a set of financial interaction possibilities
998 that may include face-to-face service provision, telephone and digital technologies, as well as physical financial artifacts
999 such as cash, paper application forms or paper receipts. A varied set of interaction channels and artifacts will allow
1000 citizens to choose the most appropriate ones, taking into account their specific circumstances; their knowledge, comfort
1001 and experience; as well as the nature of the product or service. Monzo's design concept for allowing customers "*to*
1002 *choose their preferred form of communication*" [9] is within this spirit of complementarity. Sadly, at the time of writing,
1003 Monzo has yet to implement this proposal.
1004
1005

1006 **3. Reflection:** This sensitivity requires designers to tackle the problems caused by the absence of friction. It demands
1007 that we create space for reflection in our interactions with financial technologies. Several design traditions can contribute
1008 to this endeavour, such as slow technology [32], reflective design [73], and the concept of "microboundaries" [16].
1009 Current examples of adding friction to financial technologies mostly involve introducing delays. For instance, by asking
1010 to confirm a transaction after 12 or 24 hours [26]; or by establishing "*cooling off periods*" [26] to deactivate gambling
1011 blocks [46]. However, the reflection design agenda should aim beyond the supply of time. Its ultimate goal is supporting
1012 "*value-led behaviour*" [16], assisting people in interacting with technology in ways that align with their values and
1013 preferences [16]. This includes encouraging reflection about the consequences of our financial transactions, both for us
1014 and our "*circle of care*" [75]; our consumption habits; and the impact of our chosen means of payment [27]. Introducing
1015 reflection actually aligns with the core strategy behind several of the friction workarounds developed by our own
1016 participants, such as the use of top up debit cards that invited thought about spending through the act of transferring
1017 funds onto the card; or letting online shopping baskets rest overnight.
1018
1019

1020 **4. Collaboration:** Designers should recognise the importance of communal money practices for financial well-
1021 being [18, 28, 81, 89, 90], and technologies should encourage and amplify collaborative financial practices, rather than
1022 obstructing them. Collaboration should become a core use case in financial technology design. From pooling resources
1023 [90] to group savings [55] or giving help with minding money [65], designers should engage with the numerous and
1024 mundane ways in which collaboration around money takes place on a daily basis. Ferreira et al. demonstrate how
1025 the process of re-conceptualising money-mediated activities as social activities can take place in the case of payment
1026 transactions [27].
1027
1028

1029 **5. Participation:** Beyond the inclusion agenda, financial technologies should demonstrate a commitment to amplify
1030 the voices of those who use them. They should support them in their attempts to exercise influence over the financial
1031 system, in contesting institutional policies and practices, and in combating the endemic inequality embedded in the
1032 production and circulation of credit money [37]. In short: financial technologies should support financial citizenship.
1033 This requires moving away from the drive to optimise resources, and turning attention instead to the structural and
1034 institutional factors that contribute to relative poverty, over indebtedness and hardship. This sensitivity recalls the
1035 politically-committed nature of the Scandinavian tradition of participatory design [85], and maps to its third arena of
1036 participation, where "*the general legal and political framework is negotiated*" [43]. While participatory design interests
1037
1038
1039
1040

1041 have expanded in recent years from workplace relations to other areas [33], there has been little engagement with
1042 mainstream financial services. The lack of participatory design research in this domain is all the more striking when
1043 we consider the omnipresence and importance of such services in an increasingly financialised society, where a bank
1044 account and access to credit have become "a social necessity" [49]. There is much to gain through the introduction of
1045 participatory design processes and politics inside financial service providers.
1046

1047 The above sensitivities direct attention to all the spheres involved in financial difficulty: individuals and their
1048 communities, the financial system and society at large [2]. In doing so, they can help technology fulfill its potential for
1049 those trapped in the cycle of poor mental health and financial hardship.
1050

1051 5.3 Limitations of the Study

1052 We acknowledge several limitations in our study. First, the small number of participants (14) and their recruitment
1053 through a single charity partner mean that the sample cannot be deemed representative. Second, we note the lack
1054 of clinical data to verify our participants' self-reported diagnoses. Consequently, care should be taken with any
1055 generalisations concerning mental health drawn from our findings. The behaviours and practices described by our
1056 participants should not be construed as representative of all people experiencing mental health difficulties, or as
1057 characteristic of certain mental health conditions. The value of our qualitative study resides instead in demonstrating how
1058 lived experiences of money and poor mental health can contribute to the critical examination of financial technologies.
1059
1060

1061 6 CONCLUSION

1062 In this paper, we have discussed the role of technology in enabling and hindering the financial practices of people living
1063 with mental health conditions. We have highlighted how technology supports diverse forms of financial earmarking,
1064 budgeting and monitoring; while, at the same time, it can also increase feelings of anxiety around money, provide
1065 temptations to spend, and remove the frictions that many people felt were critical to ensuring financial stability.
1066 Our participants' experiences help us appreciate how existing financial technologies reinforce the individualisation
1067 of financial hardship through a relentless focus on optimisation. We encourage designers of these technologies to
1068 emphasise configurability, complementarity, reflection, collaboration and participation instead, so as to engage those
1069 who use them not as targets for financial inclusion, but as full financial citizens.
1070
1071

1072 ACKNOWLEDGMENTS

1073 This research was funded by a UKRI Arts and Humanities Research Council doctoral studentship (Ref: 1947353). We
1074 would like to thank our participants for sharing their experience and making this research possible.
